

Geometric Operations and Morphing

Geometric Transformation

- Operations depend on pixel's Coordinates.
- Context free.
- Independent of pixel values.

$$x \rightarrow f_x(x, y) = x'$$

$$y \rightarrow f_y(x, y) = y'$$

$$I(x, y) = I'(f_x(x, y), f_y(x, y))$$

- Example: Translation

$$x' = f_x(x, y) = x + 3$$

$$y' = f_y(x, y) = y - 1$$

$$I'(x + 3, y - 1) = I(x, y)$$

Forward Mapping

- Forward mapping:
 $x \rightarrow f_x(x, y) = x'$
 $y \rightarrow f_y(x, y) = y'$

- Problems with forward mapping due to sampling:
 - Holes (some target pixels are not populated)
 - Overlaps (some target pixels assigned few colors)

Forward Mapping

$$x' = f_x(x, y) = 2x$$

$$y' = f_y(x, y) = y$$

$$x' = f_x(x, y) = 0.7x$$

$$y' = f_y(x, y) = y$$

Inverse Mapping

- Inverse mapping: $x' \rightarrow f_x^{-1}(x', y') = x$
 $y' \rightarrow f_y^{-1}(x', y') = y$

- Each target pixel assigned a single color.
- Color Interpolation is required.

- Example: Scaling along X

– Forward mapping: $x' = 2x ; y' = y$

– Inverse mapping: $x = x' / 2 ; y = y'$

Interpolation

- What happens when a mapping function calculates a fractional pixel location?

- **Interpolation:** generates a new pixel by analyzing the surrounding pixels.

Interpolation

- Good interpolation techniques attempt to find an optimal balance between three undesirable artifacts: aliasing, blurring, and edge halos.

Nearest Neighbor Interpolation

- The assign value is taken from the pixel closest to the generated location:

$$I'(x', y') = I(\text{round}\{f_x^{-1}(x', y')\}, \text{round}\{f_y^{-1}(x', y')\})$$

- Advantage:
 - Fast
- Disadvantage:
 - Jagged results
 - Aliasing near edges

Original Image

Nearest N.
Interpolation

Original Image

Nearest N.
Interpolation

Bilinear Interpolation

- The assign value is a weighted sum of the four nearest pixels.
- Each weight is proportional to the distance from each existing pixel.

Linear Interpolation

$$\frac{x - x_w}{x_e - x_w} = \frac{v - v_w}{v_e - v_w}$$

- Isolating v in the above equation:

$$v = \alpha v_e + (1 - \alpha) v_w$$

$$\text{where } \alpha = \frac{x - x_w}{x_e - x_w}$$

Bilinear Interpolation

$$S = SE \cdot \Delta x + SW \cdot (1 - \Delta x)$$

$$N = NE \cdot \Delta x + NW \cdot (1 - \Delta x)$$

$$V = N \cdot \Delta y + S \cdot (1 - \Delta y)$$

Bilinear Interpolation

- The bilinear interpolation is the best fit low-degree polynomial of the form:

$$v(\Delta x, \Delta y) = \sum_{i,j=0}^1 a_{ij} \Delta x^i \Delta y^j$$

- The pixel's boundaries are C_0 continuous (continuous values across boundaries).

Bilinear example

Nearest N.
Interpolation

Bilinear
Interpolation

Nearest N.
Interpolation

Bilinear
Interpolation

Bicubic Interpolation

- The assign value is a weighted sum of the 4x4 nearest pixels:

$$v(\Delta x, \Delta y) = \sum_{i,j=0}^3 a_{ij} \Delta x^i \Delta y^j$$

How can we find the right coefficients?

- Denote the pixel values V_{pq} $\{p,q=0..3\}$
- The unknown coefficients are a_{ij} $\{i,j=0..3\}$

$$V_{pq} = \sum_{i,j=0}^3 a_{ij} \Delta x^i \Delta y^j \quad \text{for } p,q = \{0..3\}, \quad \Delta x, \Delta y \in [-1,2]$$

- We have a linear system of 16 equations with 16 coefficients.
- The pixel's boundaries are C_1 continuous (continuous derivatives across boundaries).

Applying the Transformation

```
T = ..... % 2x2 transformation matrix
[r,c] = size(img)

% create array of destination x,y coordinates
[X,Y]=meshgrid(1:c,1:r);

% calculate source coordinates
sourceCoor = inv(T) * [X(:) Y(:) ]' ;

% calculate nearest neighbor interpolation
Xs = round(sourceCoor(1,:));
Ys = round(sourceCoor(2,:));

indx=find(Xs<1 | Xs>r); %out of range pixels
Xs(indx)=1; Ys(indx)=1;

indy=find(Ys<1 | Ys>c); %out of range pixels
Xs(indy)=1; Ys(indy)=1;

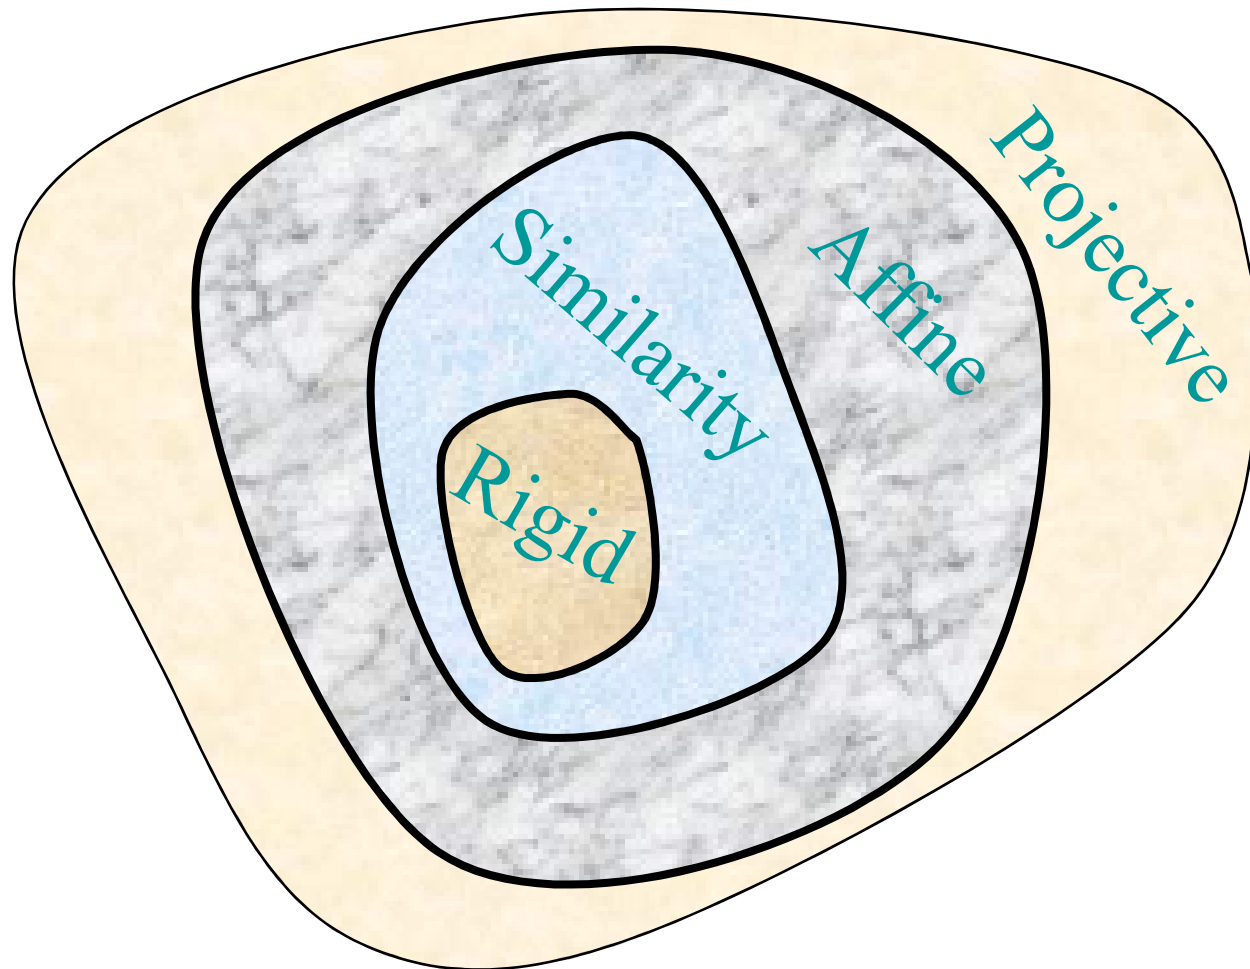

% calculate new image
newImage = img((Xs-1).*r+Ys);
newImage(indx)=0; newImage(indy)=0;
newImage = reshape(newImage,r,c);
```

Types of linear 2D transformations

- **Rigid (Euclidean)** transformation:
 - Translation + Rotation (distance preserving).
- **Similarity** transformation:
 - Translation + Rotation + Uniform Scale (angle preserving).
- **Affine** transformation:
 - Translation + Rotation + Scale + Shear (parallelism preserving).
- **Projective** transformation
 - Cross-ratio preserving
- All above transformations are groups where $\text{Rigid} \subset \text{Similarity} \subset \text{Affine} \subset \text{Projective}$

Types of linear 2D transformations

- All above transformations are groups where $\text{Rigid} \subset \text{Similarity} \subset \text{Affine} \subset \text{Projective}$

Matrix Notation

- Every location (x,y) is treated as a column vector:

$$\begin{bmatrix} x \\ y \end{bmatrix}$$

- Coordinate transformation is obtained by multiplying with a 2x2 matrix?

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} ax + by \\ cx + dy \end{bmatrix}$$

Matrix Notation - Scale

- Scale(a,b): $(x,y) \longrightarrow (ax,by)$

$$\begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} ax \\ by \end{bmatrix}$$

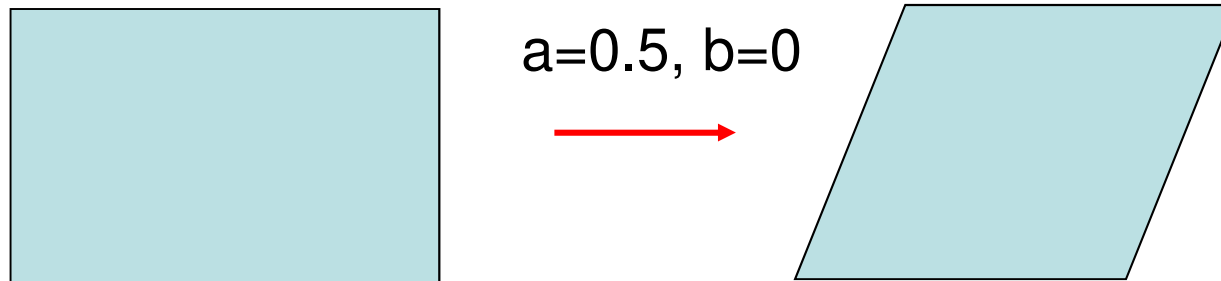

- If a or b are negative, we get reflection.
- Inverse: $S^{-1}(a,b)=S(1/a,1/b)$

$$\begin{bmatrix} 1/a & 0 \\ 0 & 1/b \end{bmatrix} \begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} x \\ y \end{bmatrix}$$

Matrix Notation - Shear

- Shear(a,b): $(x,y) \rightarrow (x+ay,y+bx)$

$$\begin{bmatrix} 1 & a \\ b & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x + ay \\ y + bx \end{bmatrix}$$

Matrix Notation - Rotation

- Rotate(θ):

$$(x,y) \longrightarrow (x\cos\theta+y\sin\theta, -x\sin\theta + y\cos\theta)$$

$$\begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x\cos\theta + y\sin\theta \\ -x\sin\theta + y\cos\theta \end{bmatrix}$$

- Inverse: $R^{-1}(\theta)=R^T(\theta)=R(-\theta)$

Matrix Notation - Translation

- Translation(a,b): $\begin{bmatrix} x \\ y \end{bmatrix} \rightarrow \begin{bmatrix} x + a \\ y + b \end{bmatrix}$
- Cannot represent translation using 2x2 matrices.
- Inverse: $\begin{bmatrix} x' \\ y' \end{bmatrix} \rightarrow \begin{bmatrix} x' - a \\ y' - b \end{bmatrix}$

Homogeneous Coordinates

- Homogeneous Coordinates is a mapping from \mathbb{R}^n to \mathbb{R}^{n+1} :

$$(x, y) \rightarrow (X, Y, W) \equiv (tx, ty, t)$$

- Note: (tx, ty, t) all correspond to the same non-homogeneous point (x, y) . E.g. $(2, 3, 1) \equiv (6, 9, 3) \equiv (4, 6, 2)$.
- Inverse mapping:

$$(X, Y, W) \rightarrow \left(\frac{X}{W}, \frac{Y}{W} \right) = (x, y)$$

Homogeneous Coordinates

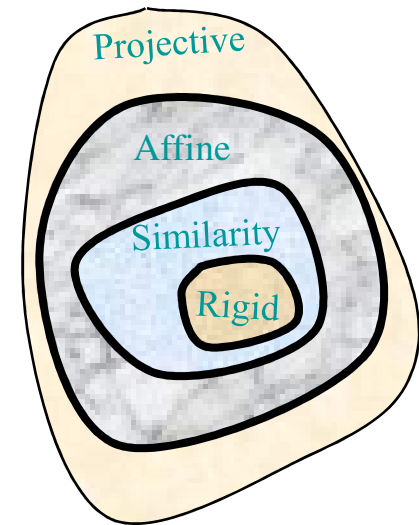

Some 2D Transformations

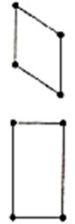

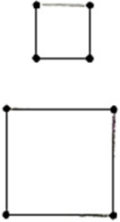

- Translation :
$$\begin{bmatrix} X' \\ Y' \\ W' \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix}$$

- Affine transformation:
$$\begin{bmatrix} X' \\ Y' \\ W' \end{bmatrix} = \begin{bmatrix} a & b & t_x \\ c & d & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Projective transformation:
$$\begin{bmatrix} X' \\ Y' \\ W' \end{bmatrix} = \begin{bmatrix} a & b & t_x \\ c & d & t_y \\ e & f & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Hierarchy of Linear 2D Transformations

Group	Matrix	Distortion	Invariant properties
Projective 8 dof	$\begin{bmatrix} h_{11} & h_{12} & h_{13} \\ h_{21} & h_{22} & h_{23} \\ h_{31} & h_{32} & h_{33} \end{bmatrix}$		Concurrency, collinearity, order of contact : intersection (1 pt contact); tangency (2 pt contact); inflections (3 pt contact with line); tangent discontinuities and cusps. cross ratio (ratio of ratio of lengths).
Affine 6 dof	$\begin{bmatrix} a_{11} & a_{12} & t_x \\ a_{21} & a_{22} & t_y \\ 0 & 0 & 1 \end{bmatrix}$		Parallelism, ratio of areas, ratio of lengths on collinear or parallel lines (e.g. midpoints), linear combinations of vectors (e.g. centroids). The line at infinity, l_∞ .
Similarity 4 dof	$\begin{bmatrix} sr_{11} & sr_{12} & t_x \\ sr_{21} & sr_{22} & t_y \\ 0 & 0 & 1 \end{bmatrix}$		Ratio of lengths, angle. The circular points, I, J (see section 1.7.3).
Euclidean 3 dof	$\begin{bmatrix} r_{11} & r_{12} & t_x \\ r_{21} & r_{22} & t_y \\ 0 & 0 & 1 \end{bmatrix}$		Length, area

Global Transformations – Image Rectification

Global Transformations – Global Warping

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = A \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Global Transformations – Global Warping

points p_i $\xrightarrow{\text{match}}$ points q_i

$$\begin{bmatrix} q_1^x & q_2^x & q_3^x \dots \\ q_1^y & q_2^y & q_3^y \dots \\ 1 & 1 & 1 \end{bmatrix} = A \begin{bmatrix} p_1^x & p_2^x & p_3^x \dots \\ p_1^y & p_2^y & p_3^y \dots \\ 1 & 1 & 1 \end{bmatrix}$$

Global Transformations – Global Warping

Inverse Mapping:

points p_i

← match

points q_i

$$\begin{bmatrix} p_1^x & p_2^x & p_3^x \dots \\ p_1^y & p_2^y & p_3^y \dots \\ 1 & 1 & 1 \end{bmatrix} = A^{-1} \begin{bmatrix} q_1^x & q_2^x & q_3^x \dots \\ q_1^y & q_2^y & q_3^y \dots \\ 1 & 1 & 1 \end{bmatrix}$$

Global Transformations – Global Warping

Solve for A^{-1} in terms of the least mean square.
i.e. find A^{-1} which minimizes:

$$\sum_i \| p_i - A^{-1} q_i \|_2$$

Global Transformations – Global Warping

solution:

$$A^{-1} = \begin{bmatrix} p_1^x & p_2^x & p_3^x \dots \\ p_1^y & p_2^y & p_3^y \dots \\ 1 & 1 & 1 \end{bmatrix} \text{pinv} \left(\begin{bmatrix} q_1^x & q_2^x & q_3^x \dots \\ q_1^y & q_2^y & q_3^y \dots \\ 1 & 1 & 1 \end{bmatrix} \right)$$

$$\text{pinv}(X) = X^T (XX^T)^{-1}$$

Global Transformations – Global Warping

Alternative representation:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = A \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & e \\ c & d & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Rearrange:

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} x & y & 0 & 0 & 1 & 0 \\ 0 & 0 & x & y & 0 & 1 \end{pmatrix} \begin{pmatrix} a \\ b \\ c \\ d \\ e \\ f \end{pmatrix}$$

Global Transformations – Global Warping

$$\begin{pmatrix} p_x^1 \\ p_y^1 \end{pmatrix} = \begin{pmatrix} q_x^1 & q_y^1 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^1 & q_y^1 & 0 & 1 \end{pmatrix} \begin{pmatrix} a \\ b \\ c \\ d \\ e \\ f \end{pmatrix}$$

Global Transformations – Global Warping

$$\begin{pmatrix} p_x^1 \\ p_y^1 \\ p_x^2 \\ p_y^2 \\ p_x^3 \\ p_y^3 \end{pmatrix} = \begin{pmatrix} q_x^1 & q_y^1 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^1 & q_y^1 & 0 & 1 \\ q_x^2 & q_y^2 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^2 & q_y^2 & 0 & 1 \\ q_x^3 & q_y^3 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^3 & q_y^3 & 0 & 1 \end{pmatrix} \begin{pmatrix} a \\ b \\ c \\ d \\ e \\ f \end{pmatrix}$$

Global Transformations – Global Warping

solution:

$$\begin{pmatrix} a \\ b \\ c \\ d \\ e \\ f \end{pmatrix} = \text{pinv}' \begin{pmatrix} \begin{pmatrix} q_x^1 & q_y^1 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^1 & q_y^1 & 0 & 1 \end{pmatrix} \\ \begin{pmatrix} q_x^2 & q_y^2 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^2 & q_y^2 & 0 & 1 \end{pmatrix} \\ \begin{pmatrix} q_x^3 & q_y^3 & 0 & 0 & 1 & 0 \\ 0 & 0 & q_x^3 & q_y^3 & 0 & 1 \end{pmatrix} \end{pmatrix} \begin{pmatrix} p_x^1 \\ p_y^1 \\ p_x^2 \\ p_y^2 \\ p_x^3 \\ p_y^3 \end{pmatrix}$$

$$\text{pinv}'(Q) = (Q^T Q)^{-1} Q^T$$

Global Transformations – Global Warping

What about Projective Transformations?

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & e \\ c & d & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Homogeneity must be preserved!

$$x' = \frac{ax + by + e}{gx + hy + 1} \quad ; \quad y' = \frac{cx + dy + f}{gx + hy + 1}$$

Global Transformations – Global Warping

What about Projective Transformations?

$$x' = \frac{ax + by + e}{gx + hy + 1} \quad ; \quad y' = \frac{cx + dy + f}{gx + hy + 1}$$

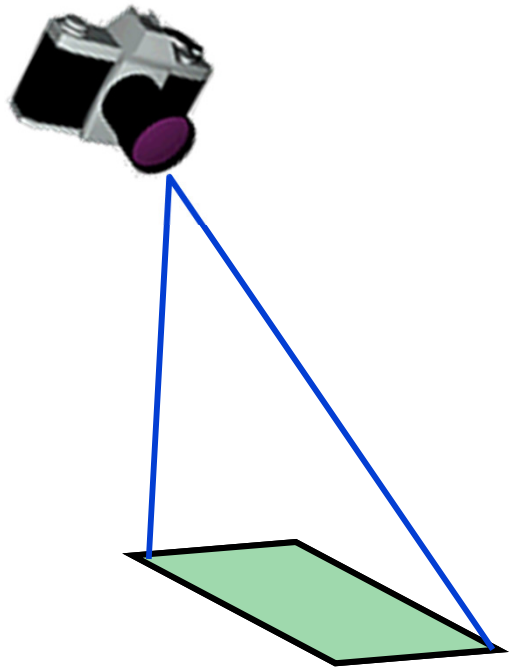

$$x' = (x \quad y \quad 0 \quad 0 \quad 1 \quad 0 \quad -xx' \quad -yx')$$

And similarly for y'

a
 b
 c
 d
 e
 f
 g
 h

Global Transformations – Image Rectification

So who ARE we?

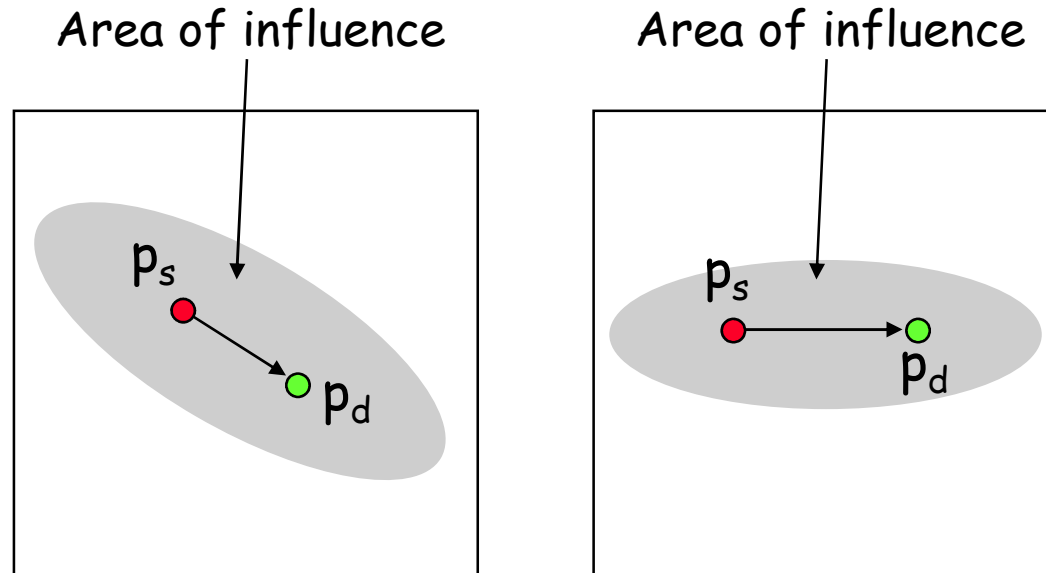

Local Transformations – Image Warping

Local Transformations – Image Warping

p_s = source point

p_d = destination point

Local Transformations – Image Warping

Area of influence

p_s = source point
 p_d = destination point

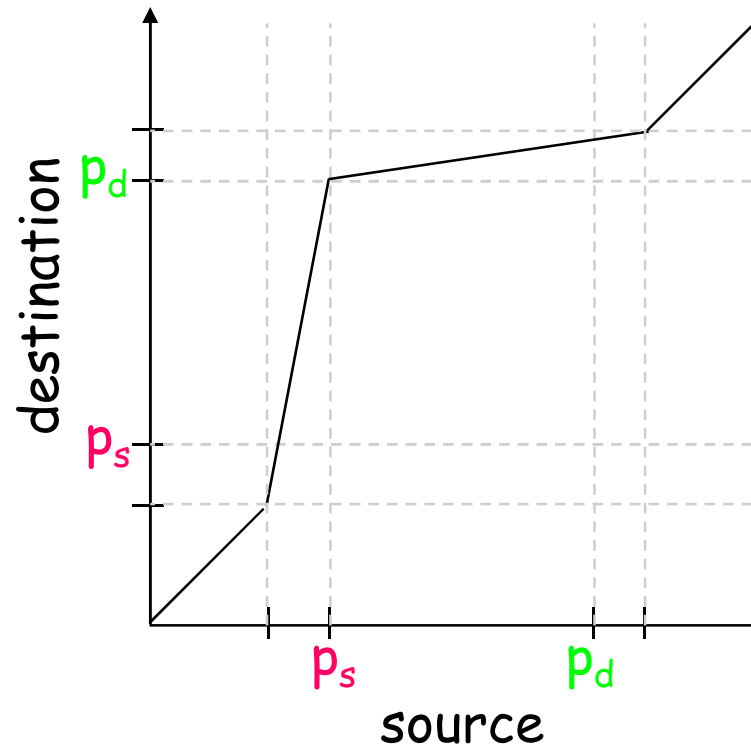

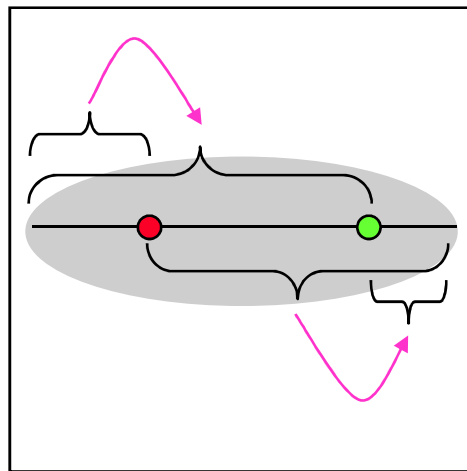

Image Morphing (Image Metamorphosis)

Cross Dissolve (pixel operations)

Source
Image

Destination
Image

t

cross dissolve

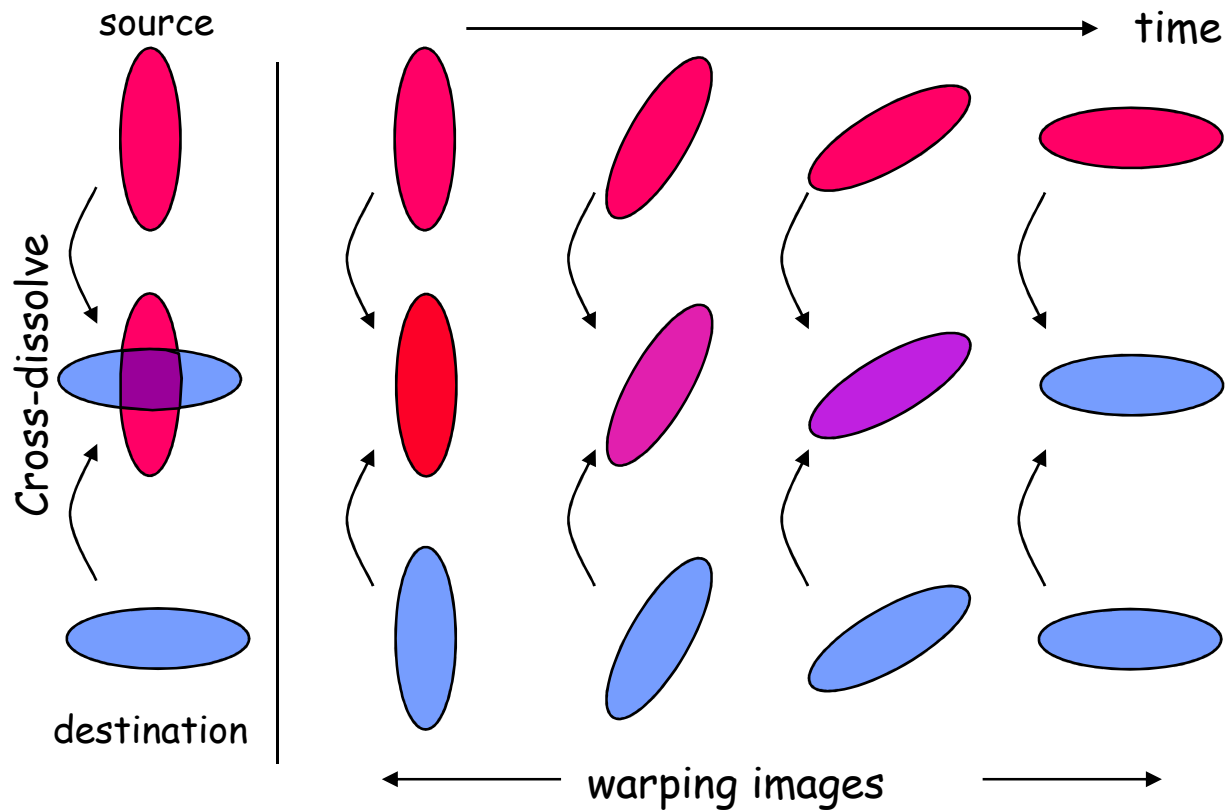

$$I(t) = (1-t) \cdot S + t \cdot T$$
$$t \in [0,1]$$

warp + dissolve

Warping + Cross Dissolve

- Warp source image towards intermediate image.
- Warp destination image towards intermediate image.
- Cross-dissolve the two images by taking the weighted average at each pixel.

Cross-dissolve

Cross-dissolve

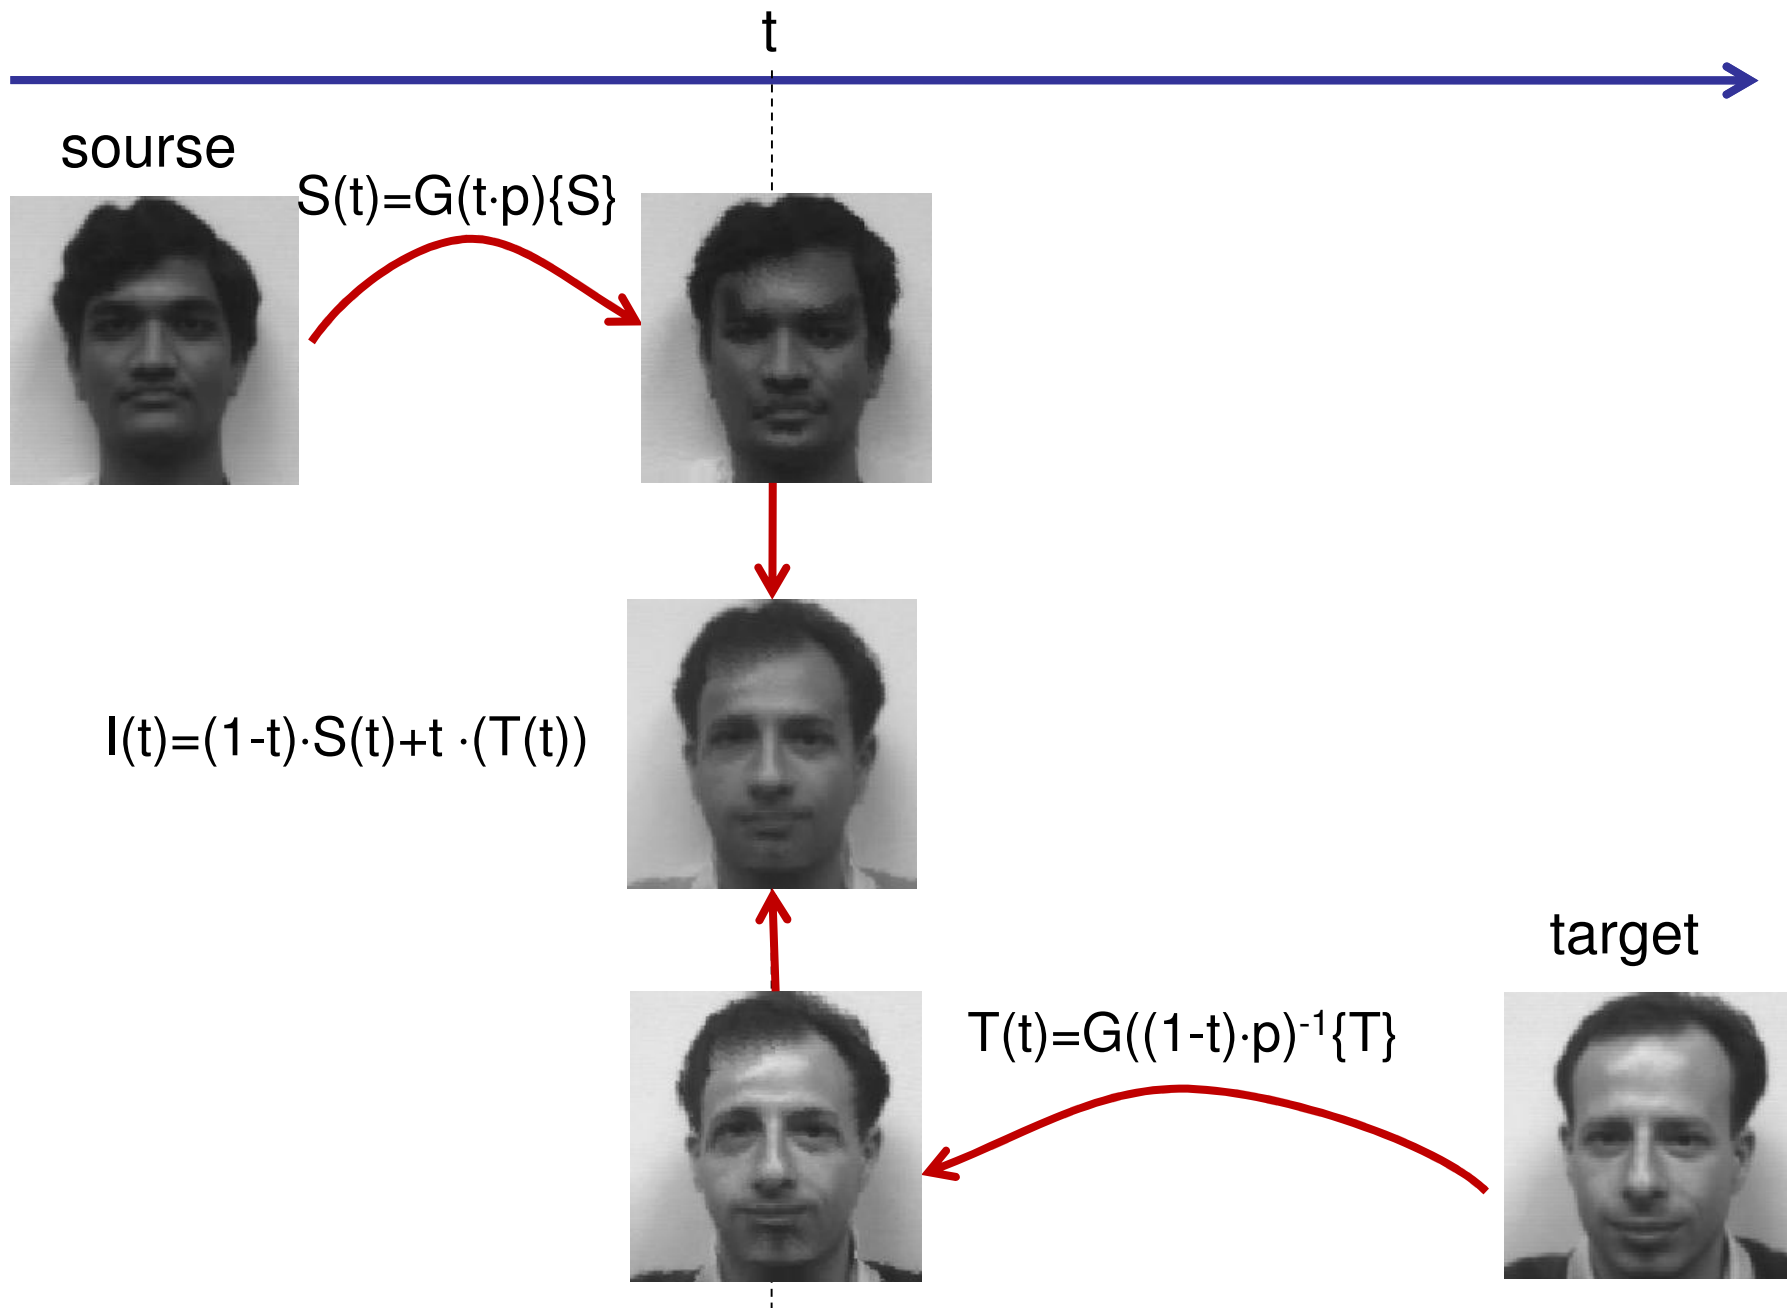

Image Metamorphosis

- Let S, T be the source and the target images
- Let $G(p)$ be the transformation from S towards T , where $G(0)=I$ (the identity)
- Let $t \in [0, 1]$ the time step to be synthesized

Algorithm:

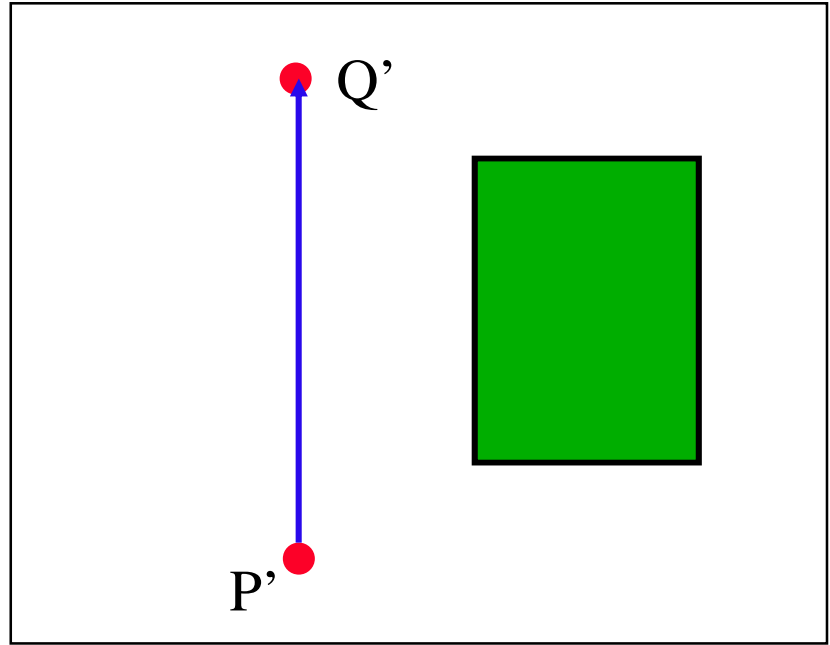

1. Warp S towards T : $S(t) = G(t \cdot p)\{S\}$
2. Warp T toward S : $T(t) = G((1-t) \cdot p)^{-1}\{T\}$
3. Cross dissolve: $I(t) = (1-t) \cdot S(t) + t \cdot T(t)$

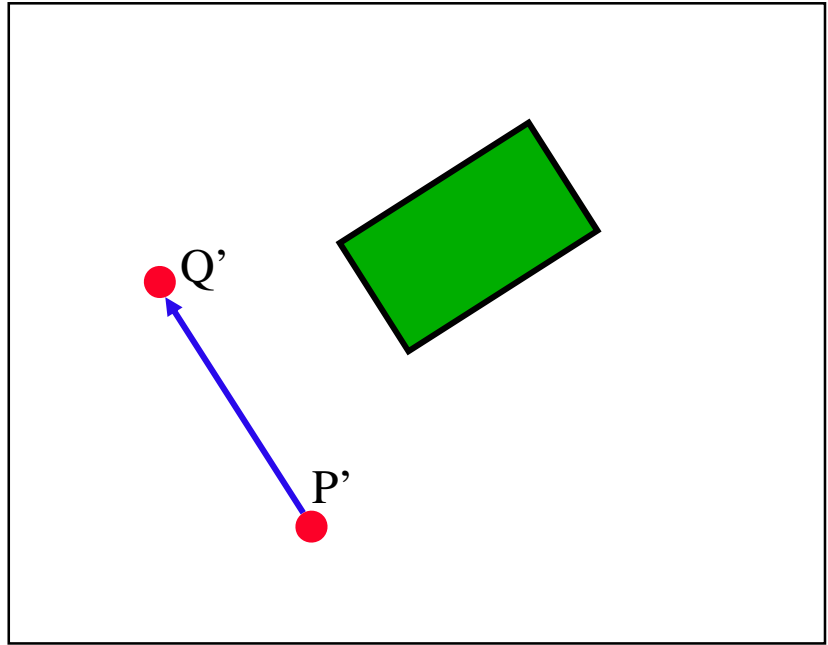

Feature Based Morphing

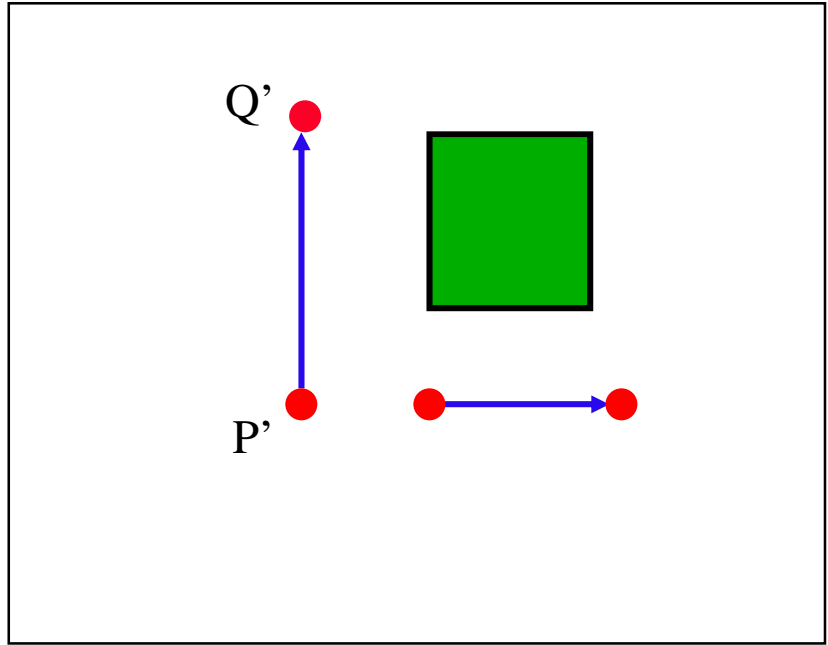

- Morph one shape into another shape
- Use local features to define the geometric warping

One Segment Warping

- $\alpha \in [0, 1]$ is the **relative** position along the segment (P', Q') .
- β is the **actual** perpendicular distance to the segment.
- (u', v') is the local coordinates of the segment (P', Q') :
 - u' is a unit vector parallel to $Q'-P'$
 - v' is the unit vector perpendicular to $Q'-P'$

$$u' = \frac{(Q' - P')}{\|Q' - P'\|} \quad v' = \perp u' = \begin{pmatrix} u'_y \\ -u'_x \end{pmatrix}$$

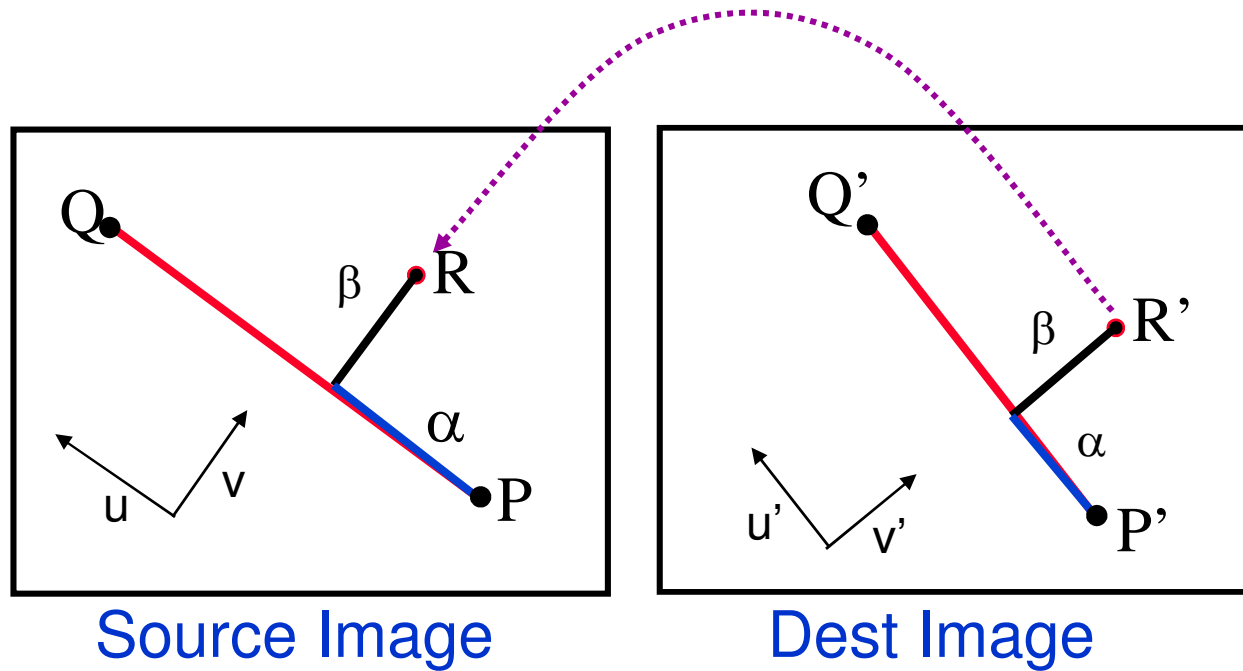

- The point R' is mapped into (α, β) :

$$\alpha = \frac{(R' - P') \cdot u'}{\|Q' - P'\|} \quad ; \quad \beta = (R' - P') \cdot v'$$

where

$$R' = P' + \alpha \|Q' - P'\| u' + \beta v'$$

Inverse Mapping:

$$R(\alpha, \beta) = P + \alpha \|Q - P\| u + \beta v$$

where (\mathbf{u}, \mathbf{v}) is the local coordinates of the segment (P, Q) :

$$u = \frac{(Q - P)}{\|Q - P\|} \quad v = \perp u = \begin{pmatrix} u_y \\ -u_x \end{pmatrix}$$

Multiple Segment Warping

- In multiple segment warping the point R' is influenced by multiple segments.
- The influence **strength** of each segments is proportional to:
 - Segment length
 - The distance from the point R'

- The influence of each segments is:

$$W_i = \left(\frac{|Q_i - P_i|^p}{a + \beta_i} \right)^b$$

- The value $p \in [0,1]$ controls the influence of the line length.
- The value a is a small number avoiding division by zero.
- The value b determines how the relative weight diminish as the β increases
- The final mapping is:

$$R = \frac{\sum_k W_k R_k}{\sum_k W_k}$$

Example:

Example images from:

http://www.cc.gatech.edu/classes/AY2001/cs4451_spring/projects/Seven/

For more details see:

Thaddeus Beier & Shawn Neely / Feature-Based Image Metamorphosis Siggraph '92

<http://www.hammerhead.com/thad/morph.html>

Another Example:

Mesh Warping

From:
<http://www.cs.utk.edu/~huangj/CS594F01/imageMorph.ppt>

2-Pass Mesh Warping Algorithm

The **first pass** warps the rows of the image:

For each column of the mesh determine the x-coordinates at which the mesh column crosses each image row.

2-Pass Mesh Warping Algorithm

Then, each row of the image is warped individually by linearly interpolating each segment between the x-coordinates defined by the source mesh to the size of the corresponding segment defined by the x-coordinates of the destination Mesh.

The **second pass** performs the exact same procedure on the columns of the image by interpolating the y-coordinates of the meshes.
