Halftoning (Screening)

Halftoning

GrayScale

Threshold

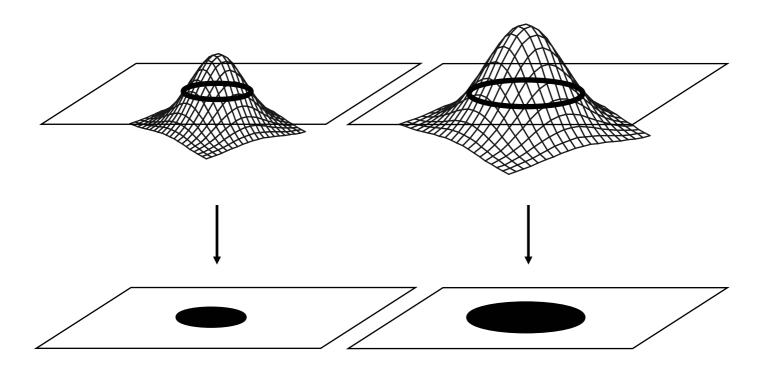

Halftone

Local average gray in halftone = image

Local average gray in grayscale image

Physical Screening

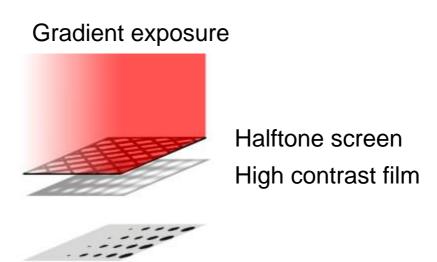

Larger hole in screen -> more ink goes through

See demo:

http://www.ted.photographer.org.uk/photoscience_halftones.htm

Physical Screening

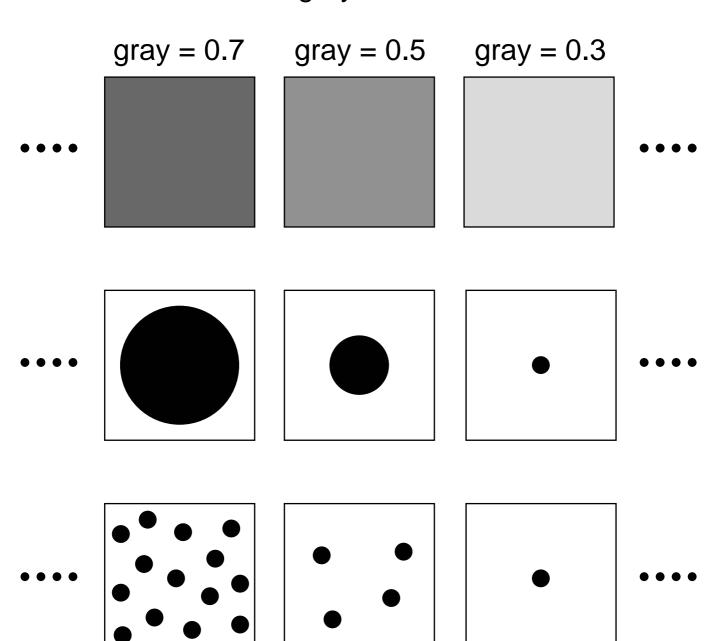

Larger hole in screen -> more light goes through

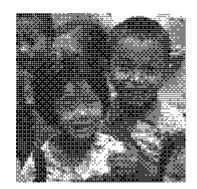

Halftoning

Percentage of ink coverage of a region determines the grayscale:

Halftoning Methods

- 1) Dithering
- 2) Error diffusion
- 3) Direct Binary Search (Iterative - error minimization)

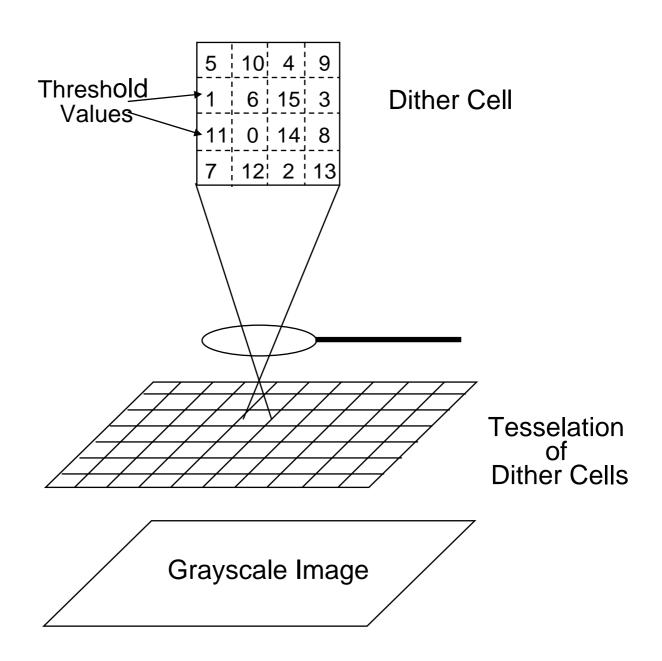

Proportion of local ink coverage = in halftone image

Local average gray in grayscale image

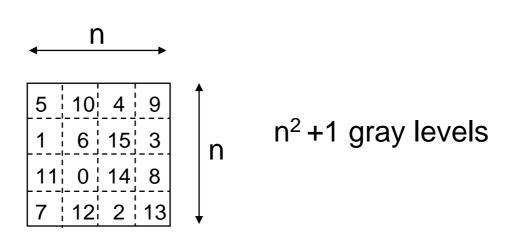

Dithering

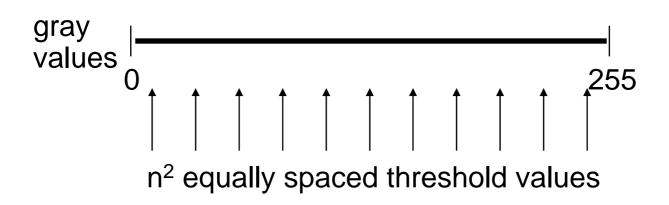

Every pixel in a region is thresholded using a different threshold value.

Threshold Values in Dither Cell

Dither Cell

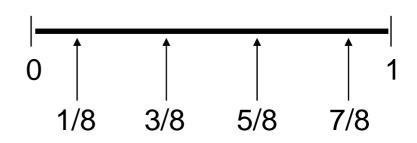

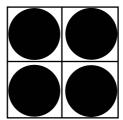

Example:

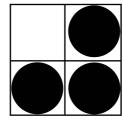

1/8	5/8
7/8	3/8

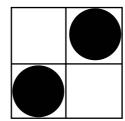

gray = 0...0.125

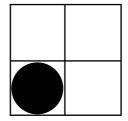

gray = 0.125...0.375

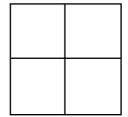

gray = 0.375...0.625

gray = 0.625...0.875

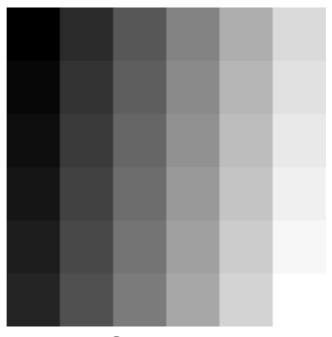

gray = 0.875...1.0

Error Diffusion (Floyd Steinberg)

Error Diffusion (Floyd Steinberg)

- Decide for each image point whether to print or not
- Take error between the desired output at that position and the printed level.
- Distribute that error forward to pixels yet-to-be printed

Example: 1D error diffusion

$$I = \begin{bmatrix} 0.7 & 0.7 & 0.3 & 0.5 & 0.1 & 0.1 & 0.1 \end{bmatrix}$$

$$I(1) = u(1) = 0.7$$
 threshold at 0.5 $b(1) = 1$

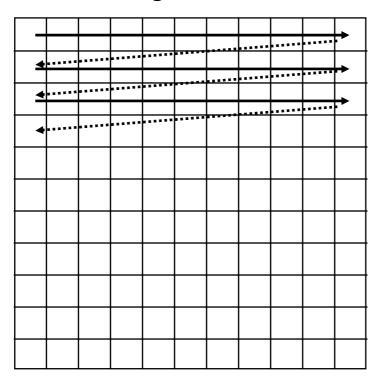

$$e(1) = b(1) - u(1) = 0.3$$

Since pixel I(1) was over represented, compensate by subtracting error from next pixel I(2)

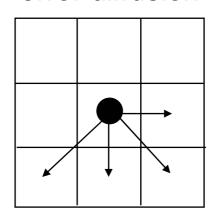

$$u(2) = I(2) - e(1) = 0.4$$
 $u(2) = 0.4 \longrightarrow \begin{array}{c} \text{threshold at} \\ 0.5 \end{array} \longrightarrow b(1) = 0$
 $e(2) = b(2) - u(2) = -0.4$
 $u(3) = I(3) - e(2) = 0.7$
and so on....

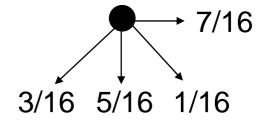

Error Diffusion in 2D

Scan Image:

error diffusion

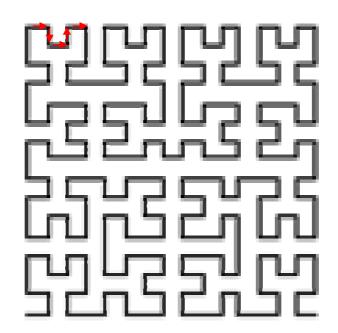

Error Diffusion - Variations

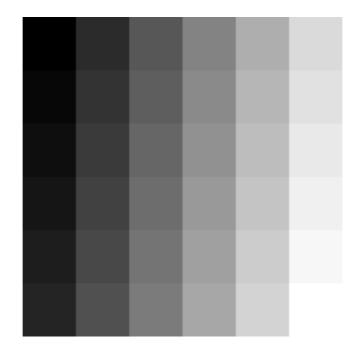

Jarvis Judice and Ninke (1976) Error diffused differently

		*	7	5
3	5	7	5	3
1	3	5	3	1

Terada, Tamura, and Saito Use Peano scan (Space filling curve)

Error Diffusion

Error Diffusion

Direct Binary Search (DBS)

Given an error metric:

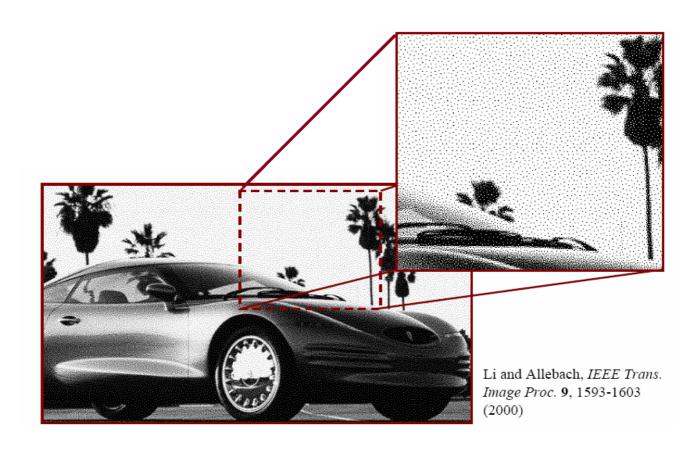

example: $d(I,b) = \Sigma((I(x,y)-b(x,y))^2)$

Initialize binary image b(x,y) (example - choose random binary image).

Randomly chose a pixel (x_0,y_0) in b(x,y) if $d(I,\tilde{b}) < d(I,b)$ then assign $b = \tilde{b}$ where \tilde{b} is b except for $\tilde{b}(x_0,y_0) = 1-b(x_0,y_0)$ Repeat last step until |d(I,b) - d(I,b)| is "small".

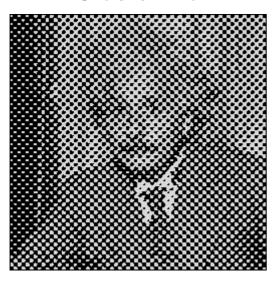

Error metric can be "smart" for example based on Human Visual System.

Direct Binary Search (DBS)

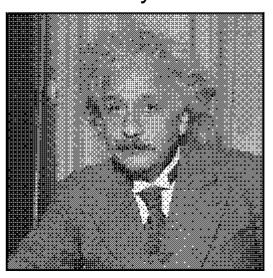

Halftoning - Comparison

Error Diffusion FM Halftoning 1975

Direct Binary Search FM Halftoning 1992

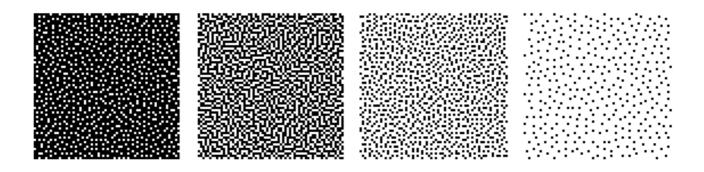

Aliasing - Moire

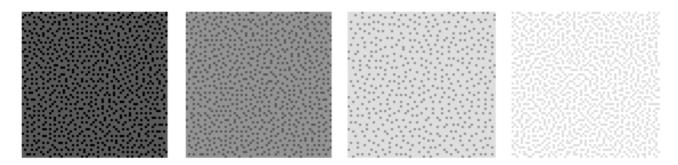

Aliasing due to dot overlap (DBS method)

Variable Dot Size

Fixed Dot Halftoning (On or Off)

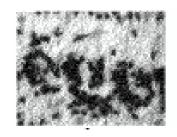

Variable Dot Halftoning (4 different dot sizes)

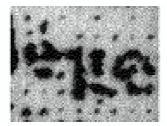

Variable Dot Size

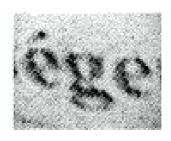

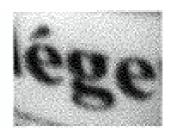

Ink Jet

Thermal transfer

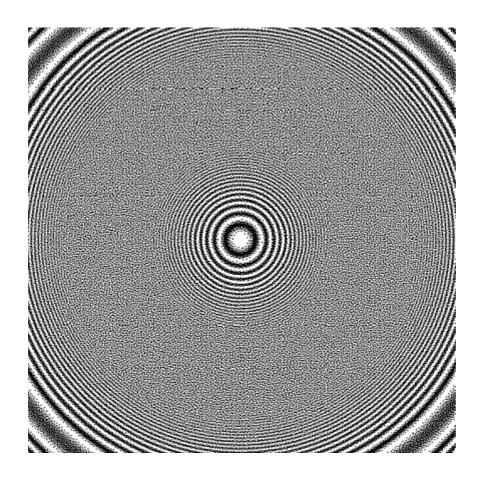

Variable dot Thermal transfer

Dye diffusion

(Moroney and Viggiani 1994)

Aliasing Removed

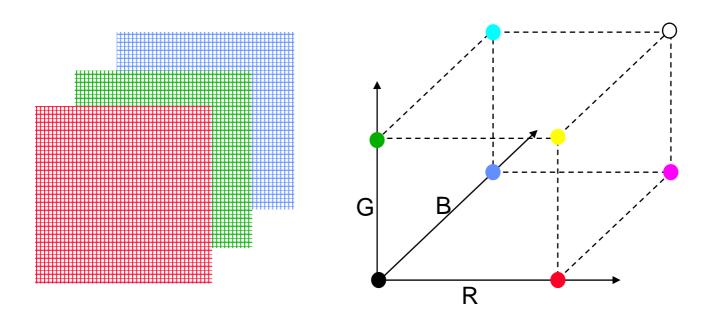

Aliasing Removed using variable dot size (dot overlap model).

(Baquai, Taylor and Allebach 1996)

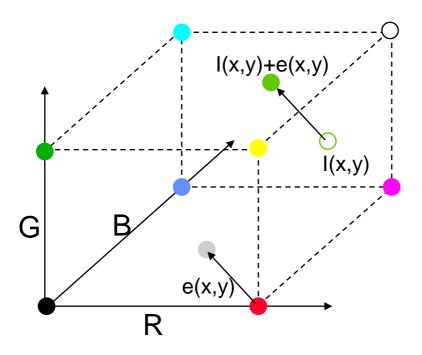

Color Halftoning

- 1) Perform halftoning in each plane (R,G,B) separately.
- 2) Perform halftoning in color space

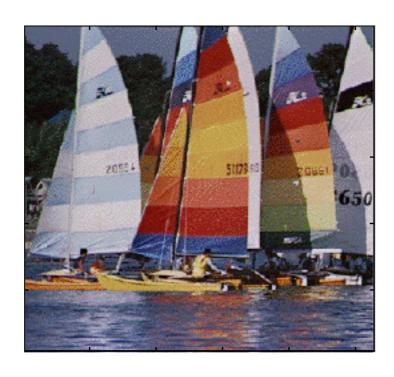

Error Diffusion in RGB Space

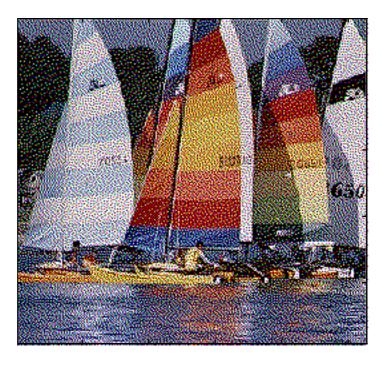

The error e(x,y) - is a vector

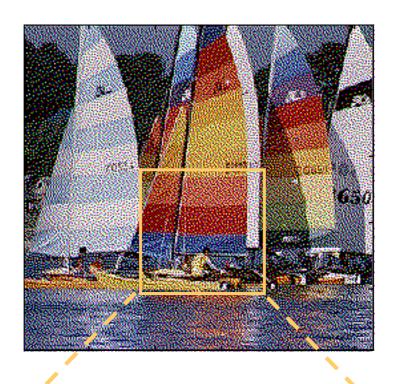

Adding and subtracting is in 3D vector space.

Error Diffusion in Color Images

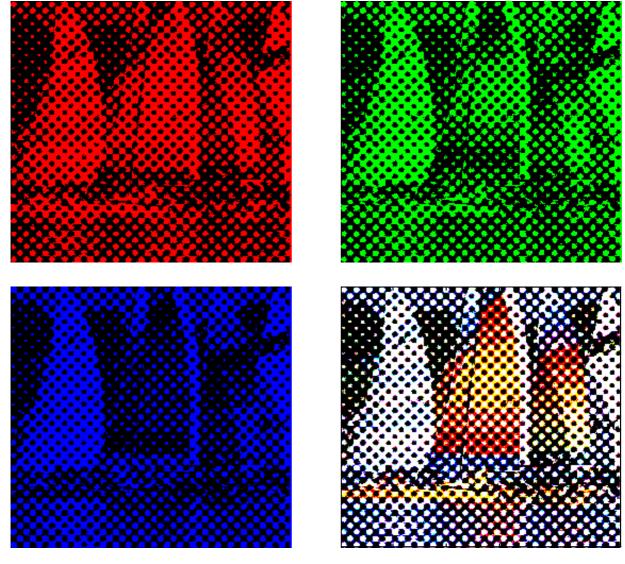

Error Diffusion in Color Images

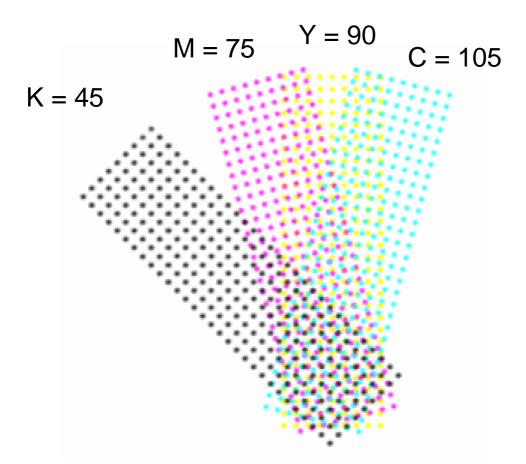

Cluster Dot Dithering in Color Images

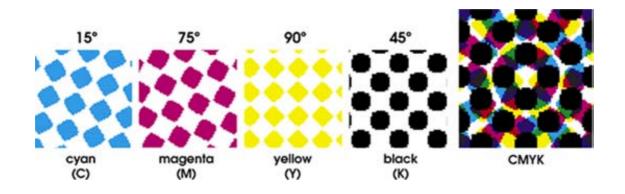

Color Screen Angles

- Every screen at a different angle.
- Optimally 30° apart.
- Since there are 4 screens and not 3:
 Y (color of least contrast) is set at 15° between 2 others.
- K (colour of most contrast) is set at the visually ideal angle of 45 degrees.

Color Screening
